

AIS Programming Standards

CICS-Related Standards

- Access to an application should be via the Application Menu.
- Security for subordinate functions should be verified in the Application Menu. If access to the subordinate function is denied, the message should appear on the Application Menu.
- Inter-application transfers should be done through the menus. Requests for transfers may take place anywhere in the application but they should go through the menus to centralize interface code.
- Startup and clean-up functions at the application level should take place in the menu or be invoked by the menu rather than repeating code in the application.
